Title

Application of integral method to single and multimachine problems in power systems 17
Coherency identification for power systems 149
Decoupled and decomposed power flow solution method 117
Decoupled internal state estimation using external system equivalents 23
Digital simulation and spectral density analysis of low-frequency power oscillations for away processor-based applications 163
Dynamic data system modelling of electrical power demand 250
Dynamic equivalent load model for power systems 142
Dynamic stability of wind-turbine generators under widely varying loading conditions 180
Economic dispatch with security constrained rescheduling 97
Efficient decoupled procedure for showing the load-flow problems during long-term dynamic process in power systems 173
Large-scale application of the Han–Powell algorithm to compact models of static and dynamic dispatch of real power 130
Long-term forecasting: a critical review of direct-trend extrapolation methods 2
Minimum frequency constrained generation margine allocation using quadratic programming 105
Mixed three-phase and six phase power system analysis using symmetrical components method 233
A model for substation reliability analysis including overload effects 194
Modelling for grid restoration studies 45
A new decentralized stabilization method with application to power system stabilizer design for multimachine systems 206
Optimal pivot strategies for load-flow calculations 66
Optimizing reactive volt-ampere regulating devices in transmission systems using a full three-phase representation 122
Optimum HVAC-transmission expansion planning 29
Power system self-excitation online security assessment 157
Probabilistic modelling of distribution harmonics: data collection and analysis 189
Recursive functional expansion technique for computer-based impedance and differential protection 225
Simulation of line and transformer outages in power systems using constant-sensitivity matrix 56
Stabilizing control for overvoltages in a separated power system with heavy load and large shunt capacitance 83
State estimation algorithm for ill-conditioned power systems by Newton's method 113
State-variable approach to analysis of power systems including HVDC convertors 241
System security control and optimal pricing of electricity 217
Topological energy-function analysis of stability of power systems 9
Updating the matrix of factors without refactorization in load-flow studies 93

Subject

Control,
  controller design 206
  economics 217
  emergency (load control, islanding, switching, reactive power) 83, 97,105
Dynamics,
  model identification, equivalents, coherency 142
  simulation of short, medium and long-term behaviour 9, 17, 45, 57,163, 173, 250
Information processing,
  data gathering, databases and information systems 189
Network analysis,
  state and parameter estimation 23
  steady-state
    analysis (loadflow, fault) 66, 93, 157, 180
    theory and modelling
      inherent network structure, properties and equivalents 233, 241
Operation,
  load dispatching (optimal loadflow, reactive power generation) 122
  long-term (generation planning energy management, maintenance scheduling) 132, 225
  short-term
    load forecasting 113
Planning,
  distribution system 2
  reliability 194
  transmission network 29
Surveys of power systems R & D 149
